

Version Control with Git

Setting Up Git

- Configure git the first time is used on a computer.
- Understand the meaning of the --global configuration flag.

When we use Git on a new computer for the first time, we need to configure a few things. Here's how Dracula sets up his new laptop:

```
$ git config --global user.name "Vlad Dracula"
$ git config --global user.email "vlad@tran.sylvan.ia"
$ git config --global color.ui "auto"
```

(Please use your own name and email address instead of Dracula's.)

He also has to set his favorite text editor, following this table:

Editor	Configuration command
nano	<pre>\$ git configglobal core.editor "nano -w"</pre>
Text Wrangler	<pre>\$ git configglobal core.editor "edit -w"</pre>
Sublime Text (Mac)	\$ git configglobal core.editor "subl -n -w"
Sublime Text (Win)	<pre>\$ git configglobal core.editor "'c:/program files/sublime text 2/sublime_text.exe' -w"</pre>
Notepad++ (Win)	<pre>\$ git configglobal core.editor "'c:/program files (x86)/Notepad++/notepad++.exe' -multiInst -notabbar -nosession - noPlugin"</pre>
Kate (Linux)	<pre>\$ git configglobal core.editor "kate"</pre>
Gedit (Linux)	\$ git configglobal core.editor "gedit -s"

Git commands are written git verb, where verb is what we actually want it to do. In this case, we're

telling Git:

- our name and email address,
- to colorize output,
- what our favorite text editor is, and
- that we want to use these settings globally (i.e., for every project),

The four commands above only need to be run once: the flag --global tells Git to use the settings for every project on this computer.

You can check your settings at any time:

```
$ git config --list
```

You can change your configuration as many times as you want: just use the same commands to choose another editor or update your email address.

★ Proxy

In some networks you need to use a proxy. If this is the case, you may also need to tell Git about the proxy:

```
$ git config --global http.proxy proxy-url
$ git config --global https.proxy proxy-url
```

To disable the proxy, use

```
$ git config --global --unset http.proxy
$ git config --global --unset https.proxy
```
